Lower Back Pain Recovery Protocol

Back conditions stem from many factors and vary widely — this is a general framework for managing mild presentations of low-back pain.

Sport Rehabilitation Specialist

RECOVERY WINDOW

6+ weeks (ongoing care)

THE THREE-PHASE PROTOCOL

1

PHASE ONE

Acute Management

7 – 10 DAYS

- Stop all aggravating activity for the first 48 hours
- Avoid sleeping prone (face-down) where possible
- Medication may be appropriate — consult a clinician
- Goal: relax the muscles and prevent spasm
- Reduce mechanical pressure on the spinal nerves

2

PHASE TWO

Subacute Recovery

2 – 6 WEEKS

- Avoid sudden movements and any heavy lifting
- Controlled stretching — ideally guided by a physiotherapist
- Massage and manual techniques to release tension
- Postural correction for daily activities and workstation

3

PHASE THREE

Long-Term Maintenance

FROM WEEK 6

- Focus on strengthening the trunk and core musculature
- Reduce load on the vertebrae through better mechanics
- Adapt long-term lifestyle and movement habits
- Find a physical activity that supports the locomotor system

RED FLAGS — WHEN TO STOP & SEEK SPECIALIST CARE

Stop training and consult a neurologist if pain increases, you experience numbness or tingling in the legs, or you feel weakness in the lower extremities.
